

NAME

`git-qseries` – list all entries from the patch queue series file

SYNOPSIS

`git qseries [-v | --verbose] [-s | --summary] [-m | --missing]`

DESCRIPTION

The **git qseries** command displays, in series order, the names of all patches which have been registered as members of the active **Git-MQ** patch series.

If the **--verbose** option is specified, each patch name is preceded by its sequence number in the series, and a single character flag, indicating its status to be one of:—

A applied: the patch has been applied.

U unapplied: the patch has *not* been applied.

G guarded: the patch has *not* been applied, and is guarded to prevent its application in the current **git qselect** state.

If the **--summary** option is specified, the commit summary line, if available in the patch header, is displayed following each patch name.

If the **--missing** option is specified, instead of listing *registered* patches, **git qseries** displays a list of patches which are present in the active **Git-MQ** patch directory, but which are *not* registered in the series file; if the **--verbose** option is also specified, no sequence number is displayed for such patches, and the status is indicated by the **D** flag.

OPTIONS

-m, --missing

List patches which lack a series file entry.

-s, --summary

Include summary lines from patch headers.

-v, --verbose

Include patch sequence numbers and status flags.

EXIT STATUS

On successful completion, **git qseries** reports an exit status code of 0. Any non-zero exit status code indicates that an error occurred.

COMPARISON WITH MERCURIAL QUEUES

Inspired by, and for the most part based on behavioural observation of **Mercurial**'s **MQ** extension, the **git qseries** command exhibits fundamentally the same behaviour as its **hg qseries** counterpart.
